Abstract	iii
Table of Contents	iv
Introduction	1
1.1 Previous Studies of the Halo Orbits	4
1.2 Introduction to the Restricted 3 Body Problem	5
1.2.1 Newtonian Formulation	5
1.2.2 Hamiltonian Formulation	8
1.2.3 Equivalence Via the Legendre Transformation	12
1.2.4 The Lagrange Points	13
Theory of Periodic Orbits	16
2.1 Persistence of Periodic Orbits and Lyapunov's Center Theorem .	16
2.2 Application to L_2	28
2.3 Poincaré Maps	34
2.4 Orbit Cylinders	38
2.5 Inherited Properties of Poincaré Maps	43
Bifurcation of Periodic Orbits in Hamiltonian Systems	49
3.1 Review of the Literature	50

3.2	Discrete Symmetries	52
3.2.1	Applications to the R3BP	55
3.3	Symmetric Periodic Orbits	58
3.4	Catalog of Generic Bifurcation Types	66
3.4.1	Bifurcations When Implicit Function Theorem Fails to Apply	66
3.4.2	Discussion of Genericity	67
3.4.3	Generic Bifurcations of Area Preserving Maps	68
3.4.4	Generic Bifurcations of Area Preserving Maps with Symmetry	73
3.5	Proof of Rimmer's Result for the Case $\lambda = +1$	76
3.5.1	Reducing a Symmetric Periodic Orbit to a Symmetric Map	76
3.5.2	Reducing Fixed Points of Maps to Critical Points of Real Valued Functions	84
3.5.3	Remarks and Cautionary Notes	93
4.	The Numerical Algorithm to Find the Halo Orbits	96
4.1	Using Linearized Vector Field to Approximate Small Orbits	96
4.2	The Algorithm to Refine Initial Conditions	99
4.2.1	The Variational Equations	101
4.2.2	Computation of the Poincaré Map and its Derivatives	105
4.2.3	Restricting the Domain of the Poincaré Map	107
4.2.4	Newton's Method Fails When Restricted to Energy Submanifold	109
4.3	Numerical Continuation of the 1-parameter Family	110
4.4	Results on the Planar and Halo Families	111

4.4.1	Evolution of Eigenvalues Along an Orbit	112
4.4.2	The Planar Family	114
4.4.3	Stability Regions of R. Broucke	117
4.4.4	Analysis of Halo Bifurcation	119
4.4.5	The Halo Family	122
5.	Bibliography	127
6.	Appendix: Source Code	131
6.0.6	Flowchart	131
